

forall χ : UBC edition is an open-access introductory logic textbook, developed by Jonathan Ichikawa at the University of British Columbia, based on P. D. Magnus's older version of the book.

The book covers translations, models, and proof systems (natural deduction and trees) for sentential and quantified logic, including identity. It also includes a sustained discussion of basic metatheory, with proofs of soundness and completeness for the tree system. It is designed for a one-semester course with no prerequisites.

This book is offered under a Creative Commons License. It is available as a free download for all students and instructors to use worldwide.

The LaTeX source code is also available for editing and redevelopment by other authors/instructors.
